                                                                                                     GLO B., Kuno K., Harada A., Matsushima K.;
Submitted (JAN-1997) to the EMBL/Genbank/DDBJ databases.
-- FUNCTION: RECEPTOR FOR A C.-C TYPE CHRANKINE. BINDS TO MIP-1-ALPHA,
MIP-1-BERA AND RANDES AND SUBSEQUENTLY TRANSDUCES A SIGNAL BY
INCREASING THE INTRACELLULAR CALCIUM IONS LEVEL.
-- SUBCRELULAR LOCATION: Integral membrane protein.
-- TISSUE SPECIFICITY: DETECTED IN MONOCYTE/MACROPHAGE CELL LINES,
BUT NOT IN NONHEMATOPOLETIC CELL LINES.
-- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 ATTAAAGATAGTCATCTTGGGGCTGGTCCTGCCGCTGCTTGTCATGGTCATCTGCTACTC
                                                                                                                                                                                                                 The present sequence is an inactive human CC (cys-cys) chemokine receptor 5 (CYES), which lacks the last 3 transmembrane regions and the regions involved in G protein-coupling. CCK5 or its CDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephritis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially human manunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2) infection, cancer, atherosclerosis and autoimmune disorders. Subjects that express the inactive receptor have a predisposition, or resistance to HIV-1 and/or HIV-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HIV-1; CCR5; CCR5-delta32; co-receptor; infection; diagnosis; AIDS;
                                                                                                                                                       Active and inactive forms of human CC chemokine receptor CCR-5 useful to diagnose, prevent and/or treat inflammatory disorders,
                                                                                                                                                                                                                                                                                                                                                         215

                                                                                                                                                                                                                                                                                                                                                              designated CCR5-Gelta32. That includes the first 4 transmembrane domains of vild-type CCR5 (see AAW88232), but lacks transmembrane domains of vild-type CCR5 (see AAW88232), but lacks transmembrane domains of CCR5 serves as a co-receptor for infection by macrophage-tropic M-tropic) strains of HTV-1. Individuals homozygous for the CCR5-delta32 mutation are resistant to HIV-1 infection, but heterozygous individuals are susceptible. The invention additionally relates to the identification of variant CCR5. The detection of CCR5 transmembrane domains 3-7 of individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to diagnostic methods for detecting the presence of such variants. A LDS. Probes and primers (see AAV84127-36) are provided for use in diagnostic methods for detecting the presence of such variants. A method is provided for inhibiting HTV-1 infection of a cell capted conding a CCR5 receptor. This involves introducing a nucleic acid encoding a CCR5 variant into the cell, thereby reducing the number of functional CCR5 molecules present on the cell surface.
                                                                                                                                                                                                 New CCR5 variant protein of the HIV-1 co-receptor - useful in developing resistance of CCR5-expressing cells to HIV-1 infection
                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of a CCR5 variant protein,
                                                            Braun J, Quillent C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       215

Human CCR5,

```
This protein comprises human MMIR-CCR, a novel C-C chemokine receptor associated with monocyte/macrophage infiltration and chemotaxis and haematopolesis. The amino acid sequence was deduced chemotaxis and haematopolesis. The amino acid sequence was deduced from a cDNA clone (see AAT9542) obtained from a cDNA library made from a cDNA clone (see AAT9542) obtained from a cDNA library made culture, i.e. cells associated with inflammation and culture, i.e. cells associated with inflammation and clumnomodulation. Another novel chemokine receptor, MPRG-CCR (see AAM36767), is also claimed. MMIR-CCR contains 7 transmembrane spanning sequents connected by a serives of infracellular and extracellular loops. MMIR-CCR and MPRG-CCR can be used to study, diagnose and treat disease states in which normal leukocyte cunction is perturbed by normal leukopolesis or inappropriate action activation via chemokine agonists or antagonists, such as infection, inflammation, proliferation, solid tumours, cardiovascular disease, abnormal cell proliferation, solid tumours, cardiovascular granulomatous disease, athma, myasthenia gravis, diabetes, choaise rusinaent such control of anthartis, alveolitis, atherosclerosis, chronic chadiar-usinaent such control of such control of such control of such control of chadiar-usinaent control of such control of chadiar-usinaent control of chadi

The present sequence is human CC (Cys-Cys) chemokine receptor 5 (CCR5), which is stimulated by MIP-1 alpha, MIP-1 beta or RANTES chemokines, but not by monocyte chemoattractant protein 1 (MCP-1), MCP-2, MCP-3, interleukin-8 (IL-8) or growth related gene product alpha (GRO alpha) chemokines. Active CCR-5 is also a receptor of human immunodeficiency virus type 1 or type 2 (HIV-1 or HIV-2). CCR5 or its cDNA can used to diagnose, treat and/or prevent inflammatory diseases, e.g. rheumatoid arthritis, glomerulonephitis, asthma, idiopathic pulmonary fibrosis and psoriasis, viral infections, especially HIV-1 or HIV-2 infection, cancer, atherosclerosis and autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            352

Its amino sequence was deduced from a cobna cone (AA785161) isolated from a macrophage library. It shows 62% identity to CCCKR1. Chemokine receptor 88-2B (see AAW27124) has also been identified. 88C and 88-2B receptors and their polypeptide fragments can be produced in transformed host cells. The receptors, peptides comprising one or more of the extracellular or intranclular domains, and anti-receptor antibodies can be used to modulate receptor activities, particularly ligand and G protein binding, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is a 7-transmembrane protein involved in signal transduction. Its amino acid sequence was deduced from a cDNA clone (AAT44042) isolated from a human monocyte library. Isolation of the cDNA allows prodn. of recombinant HDSNIO in host, e.g. E, coli, COS or Sf9, cells. The recombinant receptor can be used to identify agonists or antagonists of the receptor; such cpds. can be used to treat conditions related to the under- and over-expression of 6-protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human G-protein chemokine receptor, HDGNR10 - useful to identify (ant)agonists, for treatment of haematopoiesis, leukaemia, chronic and acute inflammation, rheumatoid arthritis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human mature G-protein chemokine receptor HDGNR10 (AAW07602)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    G-protein chemokine receptor; HDGNRIO; signal transduction; haematopoiesis; leukaemia; inflammation; rheumatoid arthritis;
are potentially potentially useful in the treatment of atherosalerosis, rhemmatoid arthritis, tumours, asthma, viral infection, AlbS, inflammatory conditions, pathological immune response, abnormal haematopoletic processes etc.
                                                                                                                                                                                                                      352

This protein sequence comprises of a novel human macrophage-selective CC chemokine receptor that has been designated CCR5. The sequence was deduced from an isolated obox clone (see AAT/6920). An Ala12/Leu variant (see W28840 of CCR5 was also identified. The susceptibility of human macrophages to HIV infection depends on cell surface expression of CD4 and CCR5. CCR5 is a member of the 7-transmembrane superfamily of G-protein coupled cell surface molecules. It plays an essential role in the membrane fusion step of infection by some HIV isolates. The establishment of stable, non-human cell lines and transgenic mammals having cells that coexpress human CD4 and CCR5 provides valuable tools for research of HIV infection.

Antibodies that bind to CCR5, CCR5 variants, and CCR5-binding agents capable of blocking membrane fusion between HIV and target cells represent potential anti-HIV therapeutics for macrophage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HIV-1 co-receptor CCR5
```

```
This is the amino acid sequence of wild-type human CCRS, which serves as a correceptor for infection by macrophage-tropic (M-tropic) strains of HIV-1. The invention relates to the dentification of a CCRS variant (see AAW80231), designated CCR5m303, comprising the first two transmembrane domains of wild-type CCR5, but lacking transmembrane domains 3-7. The presence of the CCR5m303 variant with the wild type CCR5 allele shows a positive correlation with resistance to infection with M-tropic HIV-1 strains, and may indicate slower progression of the disease. The detection of CCR5 variants may be used to identify individuals at lower risk of infection relative to the general population who, if infected, may exhibit slower progression to AIDS. Probes and for detecting the presence of such variants. A method is provided for inhibiting HIV-1 infection of a cell expressing the CCR5 or inhibiting HIV-1 infection of a cell expressing the CCR5 variant into the cell, thereby reducing the number of functional cCR5 molecules present on the cell surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TIAAAGATAGTCATCTTGGGGCTGGTCCTGCCGCTGCTTGTCATGGTCATCTGCTACTCG 61

The present sequence represents a human G-protein chemokine receptor designated HDGNR10. HDGNR10 polynucleotides are useful in methods of screening for compounds which bind to and either: (1) activate the HDGNR10 polypeptides causing stimulation of haematopolesis, wound healing, coagulation, and anglogenesis; treatment of solid tumours, chronic infections, leukaemia, T-cell mediated autoimmune diseases, parasitic infections, psoriasis, and to stimulate growth factor activity; or (2) inhibit activation of the HDGNR10 polypeptides which as beful for preventing and/or treating allery, atherogenesis anaphylaxis, malignancy, chronic and caute inflammation, histamine and immunoglobulin E-mediated alleryic reactions, prostaglandin-independent arbitis shock and hyper-eosinophilia syndrome. The polymucleotides are also useful for diagnostic assays for detecting diseases related to mutations in the nucleic caid sequences encoding the polymetides and for detecting an altered level of the soluble form of the receptor collypeptides. The purposes of the soluble form of the receptor of the substitute of the

This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in disease. (A) are used for the diagnosis of tumors (especially colorectal or prostatio), organ rejection, inflammation and autoimmune diseases.

Also inhibitors of (I) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthma or chronic bowel inflammation), or autoimmune diseases (rhemmatiod arthritis or lupus), where the (cardo)vascular, lymphatic, respiratory, nervous, digestive, endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives which have cytostatic, antiinflammatory, antiasthmatic, immunosuppressive, dermatological, antiinheumatic, antiarthritic.

Chemokines act on specific tumor and inflammatory cells through a constellation of chemokine receptors (CR), which control migration and proliferation of these cells. Ad80045-Ad80128 represent human chemokine fragments used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnostic agent containing two or more receptor-specific ligands, useful for detecting tumors, inflammation etc., also therapeutic use of ligand inhibitors

The specification describes an antibody which is specific for an antigenic fragment of gpl20. This antigenic fragment binds to DC-SIGN or is exposed upon gpl20 binding of DC-SIGN due to concomitant conformational change. DC-SIGN is a receptor that is specifically expressed on dendrific cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gpl20-binding C-type lectin. DC-SIGN binds is identical to a HIV-1 gpl20-binding C-type lectin. DC-SIGN binds is identical to a HIV-1 gpl20-binding C-type lectin. DC-SIGN binds attainty. The antibody of the invention inhibits the trans can antibody is useful to treat or prevent HIV infection. The present sequence represents a human CCR5 protein, which is a translocation promoting agent that interacts with CD4.

This receptor functions in HIV-1 entry into cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of human HIV-1 co-receptor CCR5.

Amino acids 2-18 in the N-terminal region of CCR5 comprise an HIV-1 sp120-binding site that determines the specificity of the interaction between CCR5 and HIV-1 sp120. Post-translational sulfation of the tyrosine residues in the CCR5 N-terminus is required for sp120 binding and may critically modulate the susceptibility of target cells to HIV-1 infection in vivo. The invention provides claimed sulfated peptides (see AABB294) that are based on the CCR5 N-terminal region and which are effective for inhibiting HIV-1 binding to CCR5. These peptides are used in claimed methods of inhibiting HIV infection of CH4+ cells, of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               preventing CD4+ cells from becoming infected with HIV, of treating a subject whose CD4+ cells are infected with HIV, of treating identifying an agent which inhibits binding of a CCR5 ligand to a CCR5 receptor. The methods may be carried out in a subject, especially a human, infected (therapeutic method), not infected with HIV (prophylactic method), or in a subject who is not infected with, but has been exposed to, HIV.

protein. CRS Hooker as immand of the care control (CACA) incorrect protein. CRS Hooker as a notated with inflammation, defective or aberrant chemotaxis of immune cells, HIV infection (such as Preumocystis carfull chemotaxis of immune cells, HIV infection (such as Preumocystis carfull presenting cell interaction. The disease or disorder may also be an infectious disease (e.g. a viral infection such as mearly stage HIV infection, a cytomegalovirus infection, or a poxyirus infection), an infection, a cytomegalovirus infection, or a poxyirus infection), an infection, a cytomegalovirus infection, or a poxyirus infection), an infection, a cytomegalovirus infection, or a poxyirus infection), an infection, a cytomegalovirus infection, or a poxyirus infection), an infection, a cytomegalovirus infection, or a poxyirus infection), an infection, a cytomegalovirus infection, or a poxyirus infection), and infection, action infection, architis) or a neurodegenerative carcassion, lack of CCRS function, aberrant CCRS ligand expression, or consistent in such disand function. CCRS HORNIO protein is used as a food additive or preservative to increase or decrease storage capabilities. CCRS HORNIO DNA are useful for chromosome identification and in gene crassic ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, breast, ovary, adrenal gland, bone, bone marrow, gastrointestinal tract, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, colliss, cardiovascular disorders (myocardial ischaemias) and ulcerative colliss.

Isolated nucleic acid encoding a human G-protein chemokine receptor (CCR5) BOSMR10 polypeptide, useful for preventing or treating autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders and neurodegenerative disorders.

Example 40; Page 486-487; 495pp; English.

The present sequence is human G-protein chemokine receptor (CCR5) HDGNRIO protein. CCR5 HGGNRIO antibodies are useful for treating, preventing or ameliorating a disease or disorder associated with inflammation, defective or aberrant chemotasis of immune cells, HTV infection (such as person T-cell antigen presenting cell interaction. The disease or aberrant T-cell antigen presenting cell interaction. The disease or disorder may also be an infection disease (e.g. a viral infection such as an early stage HTV infection, a cytomegalovirus infection, or a cytomegalovirus infection, or a neurodegenerative disorder. The disease or disorder may be associated or neurodegenerative disorder. The disease or disorder may be associated or uth aberrant CCR5 expression, lack of CCR5 function. Determat CCR5 in a neurodegenerative disorder. The disease or disorder may be associated or is used as a food additive or preservative to increase or decrease control of some capabilities. CCR5 HGCNRIO DNA are useful for chromosome identification and in gene therapy. CCR5 HGGNRIO DNA, protein, cantibodies, agonists and antagonists are also useful in the disposal procession of cancer (breast, overly, adrenal breast, broas procession) and prevention of cancer (breast, overly, adrenal breast broast procession).

Patent No. 6153431

GENERAL INFORMATION:

APPLICANT: Quillent et al.

APPLICANT: Quillent et al.

TITLE OF INVENTION: HUMAN IMMUNOBERICIENCY VIRUS CO-RECEPTOR

TITLE OF INVENTION: VARIANTS ASSOCIATED WITH RESISTANCE TO VIRUS INFECTION.

NUMBER OF SEQUENCES: 23

CORRESPONDENCE ADDRESS: 2

ADDRESSER: Baker & Botts, L.L.P. attn. Lisa Kole

STREET: 30 Rockefeller Plaza
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2 TTAAAGATAGTCATCTTGGGGCTGGTCCTGCCTGCTTGTCATGGTCATCTGCTACTCG
